

Survey and solutions for potential cost reduction in the design and construction process of nearly zero energy multi-family houses

Speaker:

Michele Zinzi
ENEA, Italy

Authors:

Michele Zinzi, Benedetta Mattoni, Fabio Bisegna

Introduction

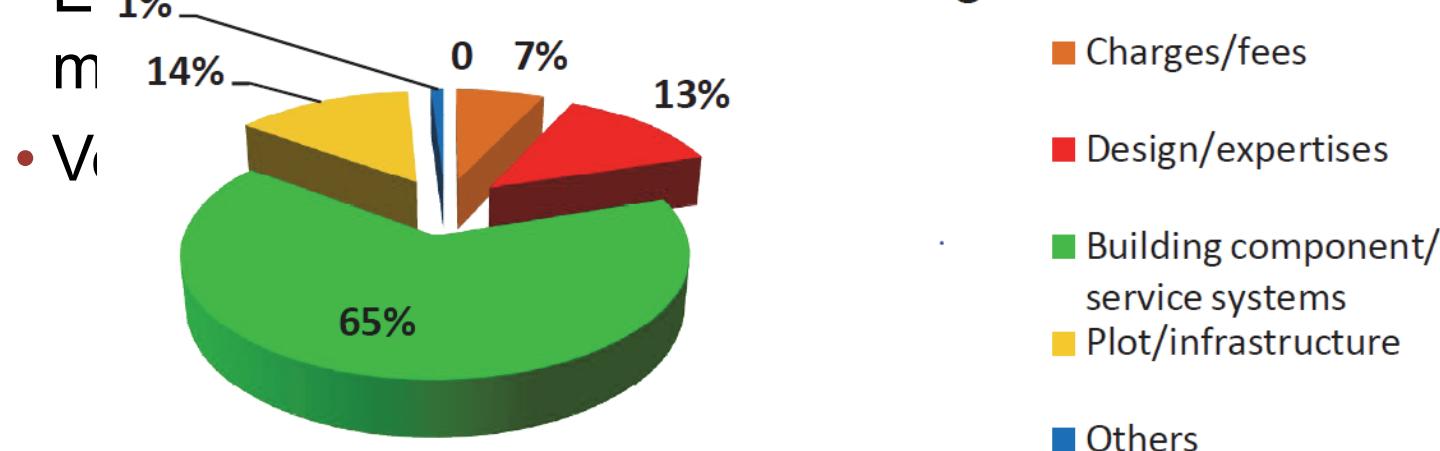

- Cost (effectiveness) analyses take into account materials and labour
- The construction process includes: design, insurances, commissioning, preliminaries.
- Preliminaries: are costs that do not refer to a specific package of work, and are mainly related to the "life cycle" of the construction site

Introduction

- Preliminaries account to 10-15% of overall construction costs

- E

Allocation of the median building cost value

Objective and method

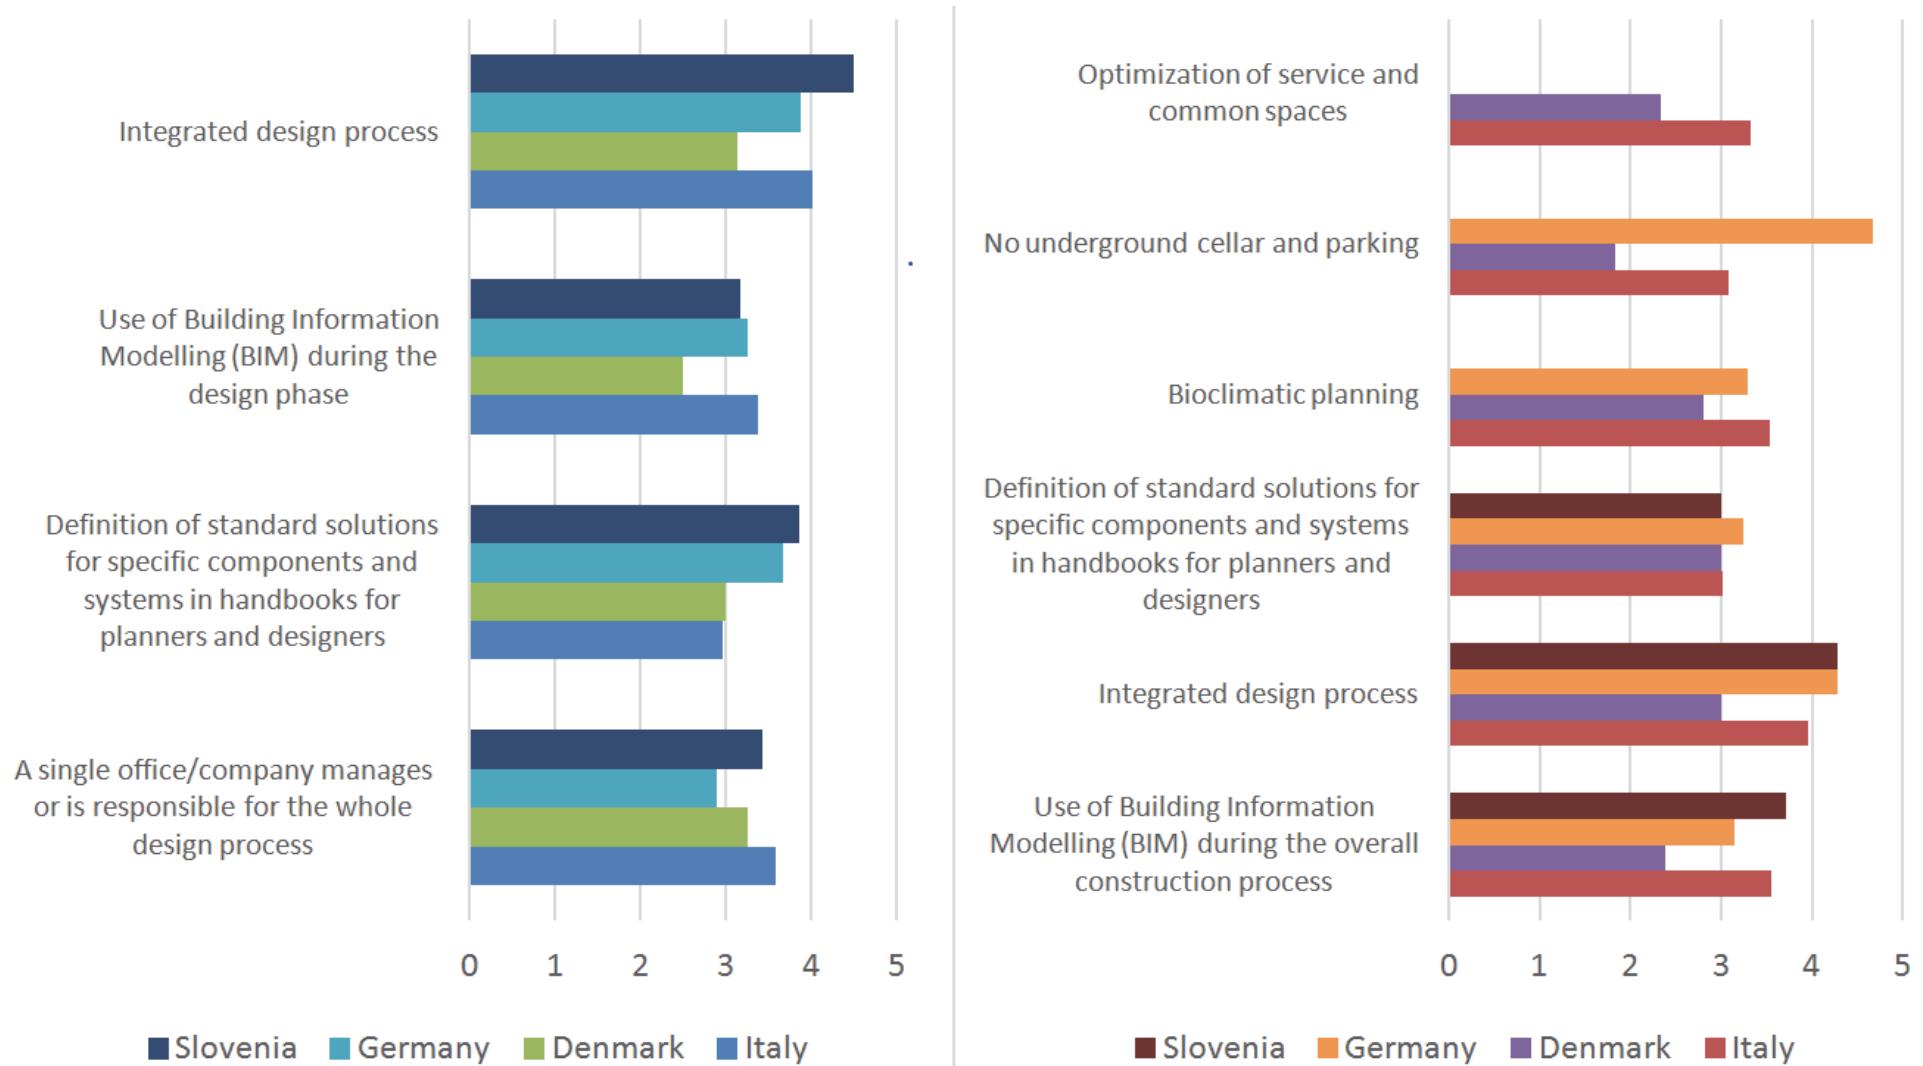

CoNZEBS started exploring this issue, through two main tasks:

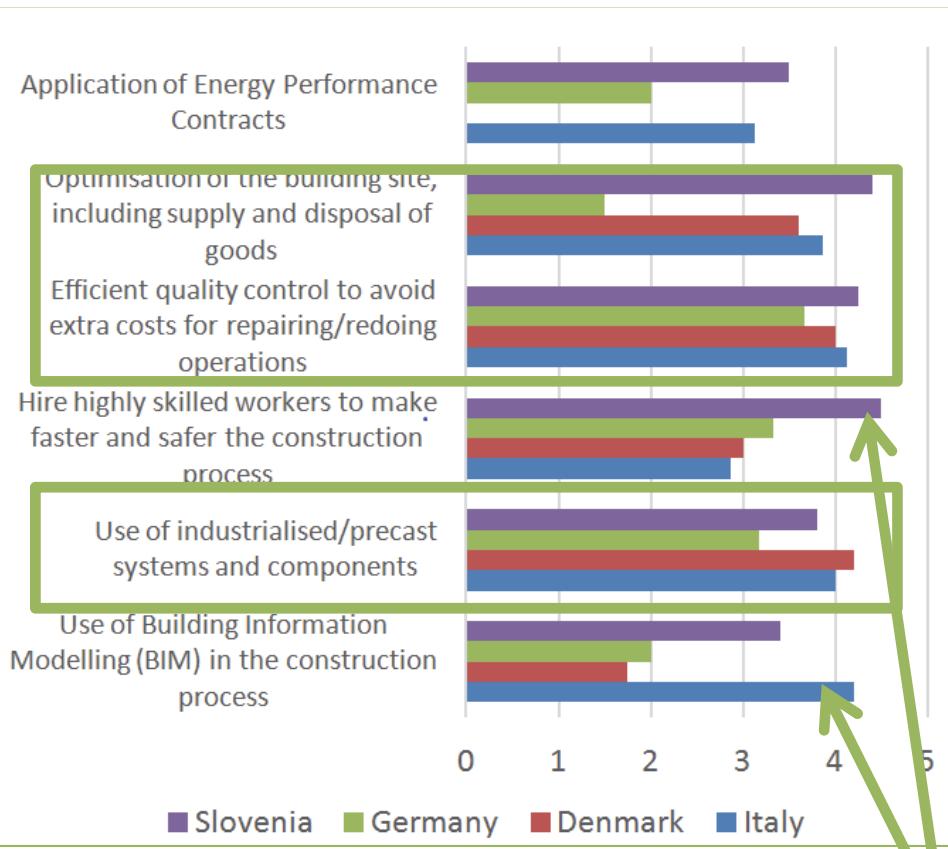

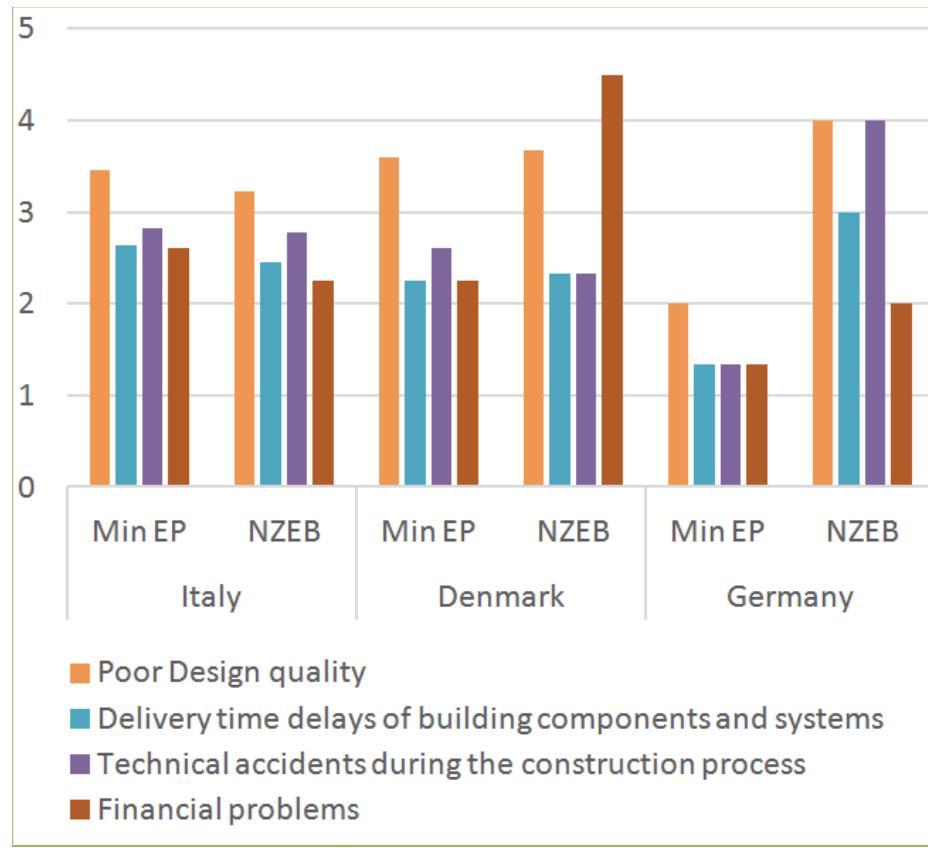

1. Involvement of relevant actors with dedicated questionnaires and interviews.
2. Provide quantitative examples of technologies able to generate savings across the whole construction process.

Questionnaire

- Two set of questionnaires were implemented for:
 - Designers and planners (individuals and studios)
 - Construction companies, (social) housing associations and contractors.
- Common core of questions with specific issues treated at national level
- Provide information about cost and management of n the design and construction process
- Identify potential solutions for cost reduction

Exemplary technologies

- The construction cost and time assessment was carried out by CoNZEBS partners with contribution of industries
- Exemplary technologies were compared versus *standard* technologies with equivalent levels of service/performance

Selected technologies

- Autoclaved aerated concrete blocks
- Monoblock windows
- PV solar roof
- Hygro-thermal ventilation

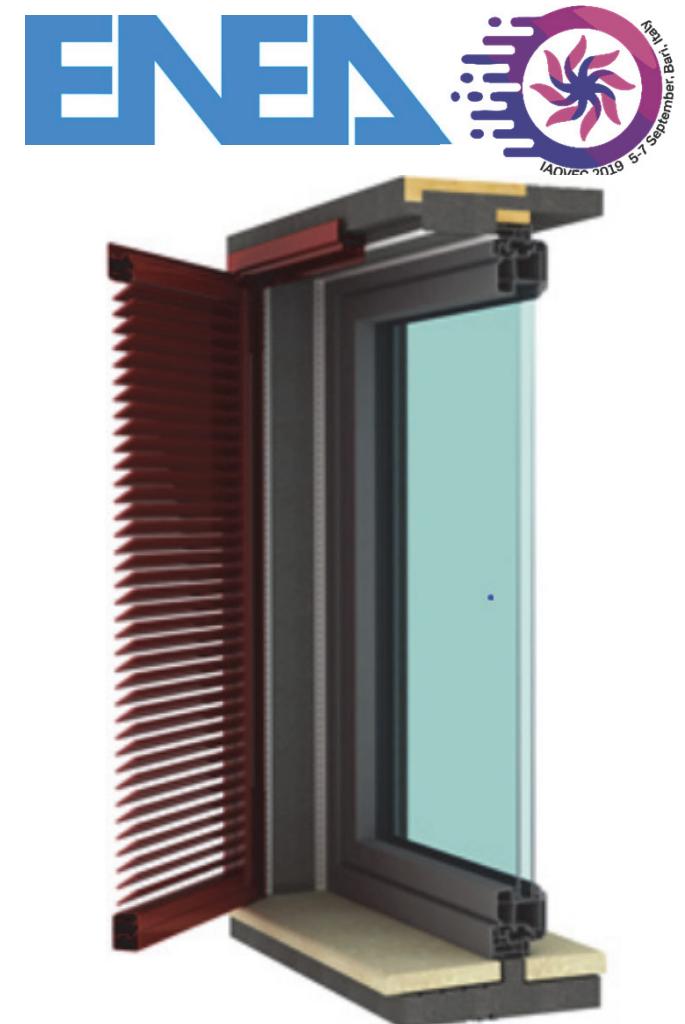

Selected technologies

- Autoclaved aerated concrete blocks
- Monoblock windows
- PV solar roof
- Hygro-thermal ventilation

Selected technologies

- Autoclaved aerated concrete block
- **Monoblock windows**
- PV solar roof
- Hygro-thermal ventilation

Selected technologies

- Autoclaved aerated concrete blocks
- Monoblock windows
- PV solar roof
- Hygro-thermal ventilation

Selected technologies

- Autoclaved aerated concrete blocks
- Monoblock windows
- PV solar roof
- Hygro-thermal ventilation

1 - Air intake with the rosettes above the windows

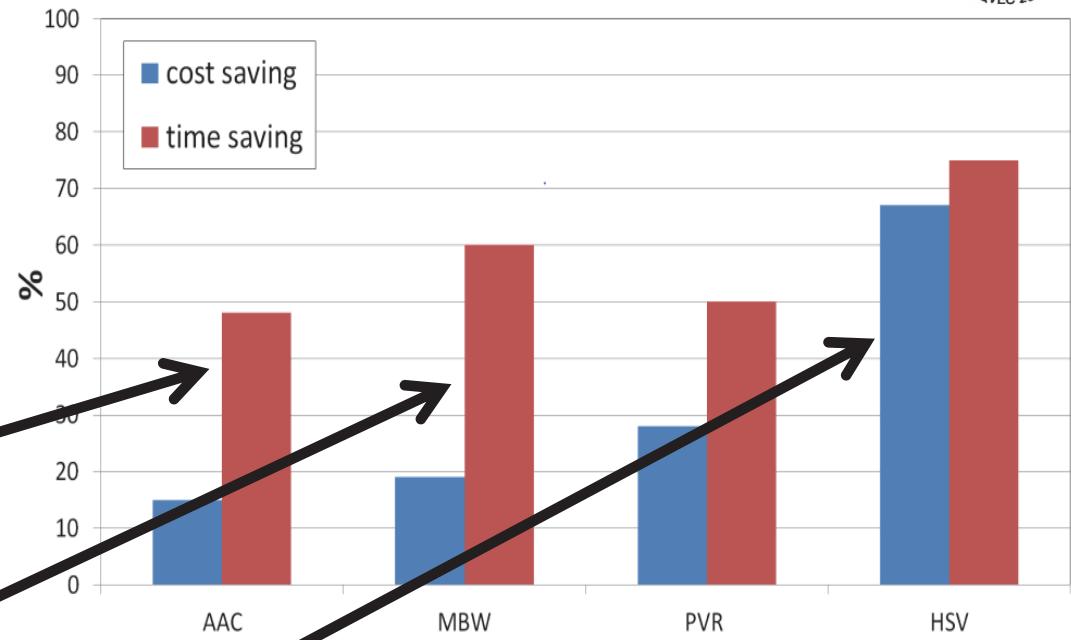

2 - suction fan

Results

- Limit on U-value
- Architectural integration
- Impact on energy performances

Conclusions

- Stakeholders detected some potential solutions to reduce cost in the design and construction process
- Savings can be achieved by optimising the construction site management, reducing the preliminaries
- Technologies exist but must be carefully assessed
- New cost effectiveness methodologies should encompass all the phases of the construction process
